Wk 14

final deadline

Form **your team**

3

members

For straightforward projects — a focused scope that three people can build and ship well.

4

members

For more complex projects — more features, a broader scope, richer final product.

All members from the same class section

Team composition is final after Week 3

Register team name + GitHub repo by Week 4

Complexity must justify team size — justify your choice in the proposal

No solo projects — minimum 3 people

Midterm presentation

You are selling your idea. Show us what you plan to build, who is building it, and that it is achievable.

01

Project concept

What does your app do?
Who is it for? What problem does it solve?
One clear sentence you can say without slides.

02

Team members & responsibilities

Show every member's name and their specific role:
Frontend · Backend · Design · DB · DevOps
No vague "contributed to everything" answers.

03

Prototype or screenshots

At minimum: wireframes of the key screens.
Better: a live Figma prototype or an early HTML mock.
Best: working code, even if rough.

04

Tech stack & hosting plan

What languages, frameworks, and libraries?
Where will you deploy? (GitHub Pages, Vercel, Netlify...)
Why did you choose these tools?

📌 Each team gets 8–10 minutes to present + 3 minutes of Q&A. Slides are optional — a live demo beats bullet points every time.

Final presentation

Ship it. The final product must be live, accessible by anyone on the internet, right now, during your presentation.

Publicly hosted

The app must be reachable via a real URL.
Free options: GitHub Pages, Vercel, Netlify, Render, Railway.
Self-signed certs or localhost = not accepted.

Production-ready

No placeholder text, broken links, or "coming soon" sections.
All core features must work on the day.
Test on Chrome AND mobile before presenting.

Meets the proposal

Your final product must implement what you proposed at midterm,
or explain (in the presentation) why scope changed.
Scope cuts are fine — surprise pivots are not.

Code on GitHub

Public repo with clear README, live URL in the repo description.
Commit history must show all members contributed.
Zero commits from one person = grade impact.

How you are evaluated

~33%

Professor

Evaluates concept clarity, technical depth, code quality, and completeness of the solution.

~33%

Teaching Assistant

Reviews code structure, version control habits, individual contribution, and documentation.

~33%

Peer students

Every student evaluates all other teams in the room — except their own team.

Professor score + TA score + average peer score

3

= your score

Evaluate **honestly**

Your peer evaluation is a grade component. Inflating scores for friends, or punishing rivals, undermines the system for everyone — including you.

✓ Evaluate every team except your own

You cannot score yourself. All other teams get your score.

✓ Use the full scale

A 7/10 for a good project and 9/10 for an outstanding one is honest.
Giving everyone 10/10 is detected and discarded.

✓ Base it on the presentation

Did they demo a real, working product?
Did all members know their part? Is the scope reasonable?

✗ Do not inflate scores for friends

Outlier scores (much higher or lower than the class average for that team) are flagged and reviewed.

✗ Do not give zero as a protest

Malicious low scores are removed from the average.
You will be contacted if your scoring pattern looks suspicious.

✗ Do not coordinate scores with your team

Identical scores submitted by a whole team for a competitor look exactly like what they are.

Final grade: how it adds up

Your project grade comes from four components — every number is independent, then combined.

40%

Midterm presentation

Proposal quality, prototype, clarity of responsibilities.

40%

Final presentation

Live product, completeness, hosting, polish.

10%

Peer evaluation (relative)

How your team ranked against others on average peer scores.

10%

Peer evaluation (absolute)

Your raw average peer score, independent of class rank.

KEY DATES

WEEK 3

Team registration deadline

WEEK 4

GitHub repo + project proposal doc submitted

WEEK 8

Midterm presentations

WEEK 13

Final product submitted + hosted

WEEK 14

Final presentations + peer evaluation

Everything on **one page**

Team

3–4 members · same section · register by Week 3

Midterm (Wk 8)

Proposal · member roles · prototype · tech stack

Final (Wk 14)

Live hosted product · GitHub repo · all features working

Evaluation

Prof + TA + peer average · honest scoring required

✓ Public URL — accessible on any device, any network

✓ GitHub repo — public, README with live link, all members commit

✓ Every member speaks during both presentations

✗ No localhost, no "it works on my machine"

✗ No AI-generated code submitted without understanding it

✗ No favoritism in peer scores — flagged and reviewed
